THE DESIGN OF YOUR AIR MOTOR:

Calculating the motor performance:

$$P = \frac{M \times n}{9550}$$

P = Power output in kW

M = Nominal torque in Nm

n = Nominal speed in rpm

Power [HP] = P [kW] x 1.34

Torque [in.lbs] = M [Nm] x 8.85

The optimal working range of an air motor is close to the nominal speed.

If you require lower speeds than those mentioned in the catalogue then you can reduce the speed smoothly by throttling the exhaust air without significant loss of performance or torque.

By throttling the supply air or decreasing the operating pressure the speed, the torque and the performance of the motor can be reduced.

All performance data for DEPRAG air motors is based on operating pressure of 6 bar and the minimum allowable opening cross-section of the feed hose as stated in each motor's data.

If your surrounding conditions vary from this you will find a comprehensive guide to our motors in brochure D6000E. We will also be happy to answer any questions directly.
